1) Java programming Syntax:-

⇒ Java is a programming language used to interact with machine & computer. It is an object oriented programming language.

⇒ Syntax for basic Java program

```
import java.io.*;
```

```
class class_name {
```

```
    public static void main (String []  
                                args) {
```

```
        System.out.print ("Message");
```

```
    } code:
```

```
}
```

```
}
```

⇒ Here, we import package from java.

⇒ class is a keyword to create a class, and should follow with class name.

⇒ public is an access modifier which is used anyone can access.

=> Static is a keyword which represent which function is constant no one can change.

=> Main is a function which is used to inform the compiler to this is start of the code.

=> Strings, [] args is used to collect input I think, it collect all data in string form.

=> System.out.println is used to print message.

2) Operators:-

=> Operators is a Symbols used to perform arithmetic operation and logical operation. It is used for operation like

=> Arithmetic Operator

=> Assignment Operator

~~=> Comparison Operator~~

=> Logical Operators

=> Bitwise Operators

i) Arithmetic operators:

=> used to perform addition, subtraction, multiplication, division

ii) Assignment operators:

=> used to assign value to left side variable
~~integers and float~~

~~operator~~
iii) comparative operators:

=> used to compare the value $>, <, >=, <=, ==, !=$

xxx

③ Looping Statement:

Looping statement is a statement used to iterate the process or value n number of time which is iterate based on condition.

Example:-

i) For loop

```
For (int i = 0; i <= 10; i++)
```

```
{
```

```
    print ("Hello");
```

```
}
```

(ii) ~~while~~ while loop

```
while (int i = 0)
{
    print ("Hi");
}
```

(iii) Do while

Do {

```
    print ("Hello user");
} while (int n equals ("user"))
```

④ Armstrong number:-

import java.io.*;

import java.util.*;

class calculateArmstrong {

```
    public static void main (String[]
        args) {
```

```
        Scanner s = new Scanner
            (System.in);
```

```
        System.out.println ("Enter
            the number");
```

```
        int N = s.nextInt();
```

```
        int temp = n;
```

```
while (temp > 0) & int x = 0;
```

```
while (temp > 0)
```

```
        int d = 0;
```

```
while (n > 0)
```

```
{
```

```
n = n - 10; g = n - 10; // 150 - 10 = 140
```

```
n = n / 10; d += r * r * r; //
```

```
}
```

```
System.out.println(d);
```

```
if (d == temp) {
```

```
System.out.println("Armstrong");
```

```
}
```

```
else {
```

```
System.out.println("No");
```

```
}
```

```
}
```

```
}
```

5

1, 3, 5, 7, 9, 7, 5, 3, 1.

```
}
```

```
}
```

5

1, 3, 5, 7, 9, 7, 5, 3, 1.

```
import java.io.*;
```

```
import java.util.*;
```

```
class Series {
```

```
public static void main (String[] args) {
```

```
Scanner s = new Scanner (System.in);
```

```
System.out.println ("Enter the limit");
```

```
int l = s.nextInt();
```

```
int n = 10;
```

```
while (n > 0) {
```

```
if (n <= 9) {
```

```
print (* n); // 1 3 5 7 9
```

```
n += 2;
```

```
}
```

else {

n -= 2;

print(n);

}
